More To See In GCT

MTA Metro-North Railroad today awarded a contract to STV, Inc. to study how to improve the information available on video monitors in Grand Central Terminal.

STV will study the technology requirements, installation needs, components, and interconnectivity for more-and more diverse-information on arrival and departure displays screens.

This three-month, \$100,000 study will determine how best to provide visual information such as weather, news, safety tips, things to see and do, places to shop and dine in Grand Central, as well as how to best promote Metro-North excursions to the scenic and historic suburbs.

The challenge for STV, which is located on Park Avenue in New York City, will be how to upgrade video technology within the terminal's landmarked building, with no structural changes, exposed ductwork, holes, or damage.

STV is one of the leaders in the field of rail transportation engineering, design and structural analysis. Work that STV performed for the renovation of Grand Central between 1996 and 1998 received awards for design excellence.
