

HOW TO READ A ROUTE PROFILE

Route Name and Descriptor

Route Map: displays the route travel path and timepoints which correspond to the ridership charts.

Frequency Chart: shows the scheduled headway of the route by hour, for weekdays, Saturdays, and Sundays (see key below the chart).

Transfer Chart*: shows the proportion of transferring passengers to/from other bus routes, to/from the subway, and non-transferring passengers.

Route Characteristics:

- Route Type** – indicates whether the route is Local, Limited, Select Bus Service (SBS), or Express.
- Route Length** – the route’s one-way mileage.
- Turns per Mile** – the average turns per mile along the route.
- Stop Spacing** – the average distance between any two sequential stops along the route, excluding non-stop segments on Express routes. If a route has both Local and Limited trips, only the Local stop spacings are considered.
- Average Speed** – the average weekday travel speed for the route.

Ridership Charts*: shows average weekday ridership by stop (boarding and alighting) and passenger load estimates.**

- Charts show the most common route variant and major branches.
- Figures along the x-axis correspond to the timepoints displayed on the route map.
- Passenger boardings and alightings are shown in bars, corresponding to the left Y-axis.
- Passenger loads (the number of people on the bus at once) are shown in continuous line charts, corresponding to the right Y-axis.

B1 86th Street

Type	Route Length	Turns per Mile	Stop Spacing	Average Speed
Local	6.8 mi	1.1	732 ft	7.1 mph

Northbound Ridership (Average Weekday)

Southbound Ridership (Average Weekday)

	Weekday		Saturday		Sunday	
	Value	Rank	Value	Rank	Value	Rank

Riders per Trip	74.3	—	68.6	—	51.1	—
CJTP (%)	71.9	—	—	—	—	—

* All data is from the MTA and is from May 2019.

** All boarding, alighting, and loading estimates are derived from the NYCT Bus Ridership Model. The model accounts for MetroCard fare registrations and GPS data on bus locations; it has been calibrated to match observed conditions, considering fare evasion, children under 44", and other riders not paying with MetroCard. As with all models, some inherent uncertainty and ridership activity may diverge from what is observed, particularly at the individual stop level. This is due to the 6-minute interval for MetroCard transaction data downloads, as many stops are closer than 6 minutes apart. Boarding, alighting, and loading estimates at or near terminals may be subject to further uncertainty, as riders may board before an operator turns on bus and sets the farebox for the departure trip.
